→ Hw. 3

→ Midterm

Assembly Language and C

- How a high-level language uses low-level language features?
- C: Used in system programming, device drivers, ...
- Use of addressing modes by compilers
- Parameter passing in assembly language
- Local storage

C and the MSP430

- Compiler and the MSP430 instruction set
- C data types and implementation
- Storage classes
- Functions and parameters
- Pointers

Compiling a C Program: Example #1

```
#include <msp430.h>

int main(void) {
    int i1, i2;
    unsigned int ui1;
    short int sint1;
    long int lint2;
    int a[4];
    // Stop watchdog timer to prevent time out reset
    WDTCTL = WDTPW + WDTHOLD;
    i1 = 2; i2 = -2;
    ui1=65535;
    sint1=127;
    lint2=128243;
    a[0]=20; a[1]=9;
    return 0;
}
```

Example #1 Compiler Generated List File

(TI Compiler, optimization: OFF, suppress debug symbols)

C Data Types

Data type	Size	Range	Alignment
bool	8 bits	0 to 1	1
char	8 bits	0 to 255	1
signed char	8 bits	-128 to 127	1
unsigned char	8 bits	0 to 255	1
signed short	16 bits	-32768 to 32767	2
unsigned short	16 bits	0 to 65535	2
signed int	16 bits	-32768 to 32767	2
unsigned int	16 bits	0 to 65535	2
signed long	32 bits	-2^{31} to $2^{31}-1$	2
unsigned long	32 bits	0 to $2^{32}-1$	2
signed long long	64 bits	-2^{63} to $2^{63}-1$	2
unsigned long long	64 bits	0 to $2^{64}-1$	2
float	32 bits		2
double	32 bits		2 (*)
double	64 bits		

C Data Types, cont'd

- Local variables
 - Defined inside a function
 - Cannot be accessed from outside the function
 - Normally lost when a return from the function is made
- Global variables
 - Defined outside a function
 - Can be accessed both from inside and outside the function
- Variables defined in a block exist only within that block

```
int i; /*global variable, visible to everything from this point*/  
void function_1(void) /*A function with no parameters*/  
{  
    int k; /*Integer k is local to function_1*/  
    int q; /*Integer q exists only in this block*/  
    int j; /*Integer j is local and not the same as j in main*/  
}  
  
void main(void)  
{  
    int j; /*Integer j is local to this block within function main*/  
} /*This is the point at which integer j ceases to exist*/
```

Storage Class Specifiers

- **auto**
 - Variable is no longer required once a block has been left; Default
- **register**
 - Ask compiler to allocate the variable to a register
 - Also is automatic
 - Cannot be accessed by means of pointers
- **static**
 - Allows local variable to retain its value when a block is reentered
 - Initialized only once, by the compiler!
- **extern**
 - Indicates that the variable is defined outside the block
 - The same global variable can be defined in more than one module

Storage Class Modifiers

- **volatile**
 - To define variables that can be changed externally
 - Compiler will not put them in registers
 - Think about Status Registers !
- **const**
 - Variable may not be changed during the execution of a program
 - Cannot be changed unintentionally, but CAN be changed externally (as a result of an I/O, or OS operations external to the C program)
- **Type conversion**
 - In C, done either automatically or explicitly (casting)

Compiling a C Program: Example #3

```
int main(void) {  
    {  
        volatile int i1, i2;  
        volatile unsigned int ui1;  
        volatile short int sint1;  
        volatile long int lint2;  
        volatile int a[4];  
    }  
    // Stop watchdog timer to prevent time out reset  
    WDTCTL = WDTPW + WDTHOLD;  
    i1 = 2; i2 = -2;  
    ui1=65535;  
    sint1=127;  
    lint2=128243;  
    a[0]=20; a[1]=9;  
    return 0;  
}
```

Example #5: Pointers and Pointer Arithmetic

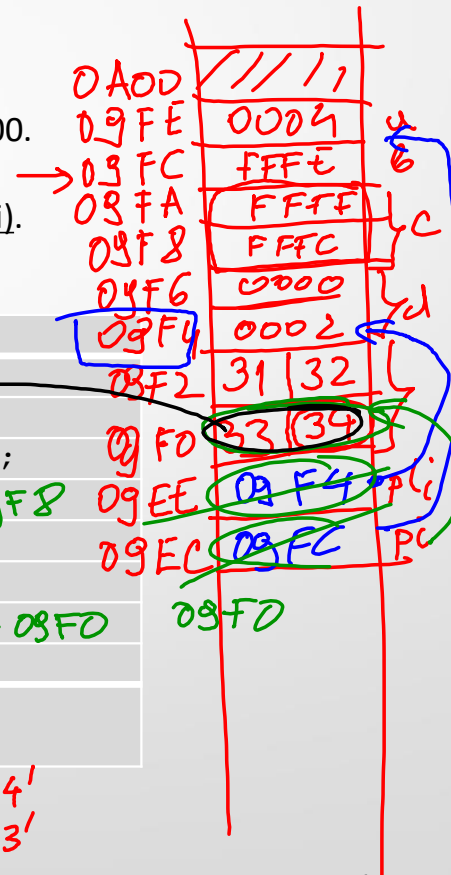

Consider the following C program.

Assume that the register SP at the beginning points to 0x0A00.

Assume all variables are allocated on the stack, and in the order as they appear in the program (a, b, c, mych, pli, pi).
 ASCII code for character '0' is 48 (0x30).

```

1  int main( void ) {
2      volatile int a = 4, b = -2;
3      volatile long int c = -4, d = 2;
4      volatile char mych[] = {'4', '3', '2', '1'};
5      volatile long int *pli = &d;
6      volatile int *pi = &b;
7      pli = pli + 1;
8      pi = pi - 6;
9      *pi = a + *pi;
10 }
  
```

$*pi = a + *pi$
 $3338 \leftarrow 0004 + 3334$

$FFFF FFFC$
 $0000 0002$

$mych[0] = '4'$
 $mych[1] = '3'$

Example #5 (cont'd)

#	Question?	Value/Address
1	The number of bytes allocated on the stack for the variables declared in line 2.	
2	The number of bytes allocated on the stack for the character array declared in line 4.	
3	The number of bytes allocated on the stack for all variables declared in lines 2-6.	
4	Value of mych[0] after initialization performed in line 4.	
5	Address of variable b (&b).	
7	Value of pli at the moment after the statement in line 5 is executed.	
8	Value of pli at the moment after the statement in line 7 is executed.	
9	Value of pi at the moment after the statement in line 8 is executed.	
10	Value of mych[0] at the moment after the statement in line 9 is executed.
